CATALOG 100.100

Porcelain and ceramic tile are both part of the larger category of tiles that can generally be called ceramics—a category that includes all rigid tiles shaped from natural earthen clays and hardened by heat. In the modern tile industry, however, porcelain tiles occupy their own category, assigned there because they meet certain specifications.

Porcelain vs. Ceramic Tile: Major Differences

According to the Tile Council of North America, industry group that decides whether a tile is porcelain or ceramic, everything boils down to whether the tile can meet a set of highly controlled water absorption criteria.¹ Both ceramic tile and porcelain tile usually receive a surface glazing that makes them hard to distinguish from one another.
